**· Cover letter ·**

Dear Hiring Manager,

As a cloud, software and data developer, I was part of a team in Merchant Services where I worked on future product propositions for green field markets. I drove the development process from idea generation, fast iterations, POC's to MVP, while navigating the landscape of big scale and legacy platforms. I was expected to stay curious while continuously challenging the current state. I was always ready to learn about other domains and able to understand the technology landscape to make recommendations on the best fit for market and customer needs. I was responsible for the further development of Azure set-up, handling data APIs, onboarding customers, developing the data pipeline and maintaining and developing the back-end to be robust, scalable, and best in class for the new products.

My most recent work scope was to create and maintain two data products: Merchant Insights and Market Insights. Merchant Insights was a tool that allowed businesses to gain deeper insights into their customers by analyzing acquiring data. By using this data, businesses were able to learn more about where their customers were from, how often they shopped, and how much they spent. The product was available via an API, so businesses could customize the insights to their specific needs.

Market Insights, on the other hand, was a service that allowed merchants and business intelligence users to identify ongoing market trends in the Nordics in real-time. Using a wide range of dynamic filters, users could tailor the insights to their business and turn the analytics into actionable insights. It also could visualize the effects of tourism or shopping trends.

I played a key role in all the new initiatives and was an expert in my field, proficient in programming languages Java, Kotlin, Quarkus, Python and have a strong background in big data management, able to work with Azure, SQL and NoSQL databases and gained experiences with event-driven architecture, domain driven design and container orchestration. I am also communicative and able to ensure that the product team understands and has access to the metrics and insights from my analysis, as well as keeping all stakeholders, including those outside of the immediate team, well-informed about relevant insights and experiments.

I am excited about the opportunity to join your team. I believe that my technical curiosity, willingness to ask questions and 'dig deeper' will be a great fit to your team.

Thank you for considering my application. I look forward to the opportunity to discuss how my skills and experience can contribute to your team's success.

Sincerely,

Peter Tomascik
